

Annales and Formalization – On Totalisation

By Shomit Sirohi

I. The Process of Totalisation in Mathematics – what is Economics then?

ZFC covers the economics practiced as in fact a Marxist type of economics which is then mathematical and is a process best described as the labour theory of value which argues for a scientific rigour which then means Annales covers this very process of individual, competition and international capital with living labour as a similar historical formalism close to Marxism – finally this is a brilliant totalization – the process of totalization argues then that formalization is a better totalization than normal processes of economics which can be misled and crisis bound if in case it does not lead a formalist process of totalization.

Totalisation is actually a process of following a scientific method and its consequences for more scientific truths and discoveries which can also just be scientific following and more strictness to its fundamental process because that is called scientific formalism such as the basic theory format of in fact Hilbert formalism which when applied in finite formats then in the sense of simply following it in institutional syntaxes then is simply formalist or formalized – Althusser fits Hilbert so does Annales and the totalization also proves that – the non-Hilbert process of refuting this for more complex or advanced economics then should be a success but is called advanced Hilbert which then is a stronger formalism.

II. Dynamics being Proven in Annales and just the scientific following style

Dynamics then prove in the sense of pure infinite coinage and processes of democracy and aesthetics and aesthetical regimes all around if followed. Scientific minimalism is to just follow it as scientific anyway which is also true of anything in Hilbert that it qualifies as Hilbert any process because of Annales being the objective process.
